

Bridges in Mathematics

Grade 4 Unit 1

Multiplicative Thinking

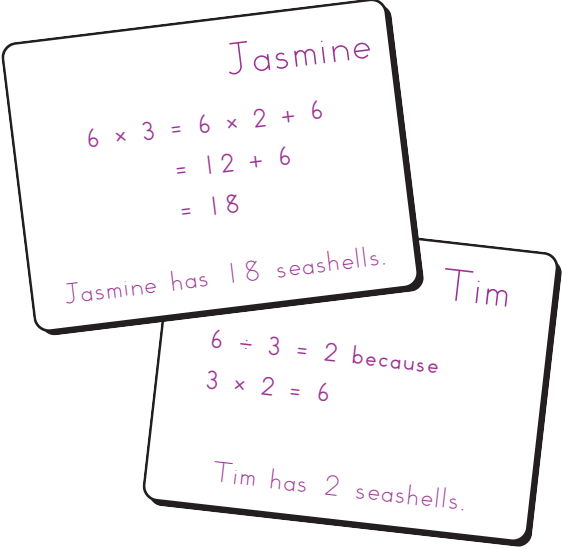

In this unit your child will:

- Fluently multiply and divide within 100
- Apply properties of operations as strategies to multiply and divide
- Use multiplication and division within 100 to solve story problems in situations involving equal groups, arrays, and measurement quantities
- Find the area of a rectangle

Your child will learn and practice these skills by solving problems like those shown below. Use the free Math Vocabulary Cards app for additional support: mathlearningcenter.org/apps

| <div style="display: flex; justify-content: space-between;"> <div style="width: 45%;"> <p>4×2</p> <p>$4 + 4 = 8$ $4 \times 2 = 8$</p> <p>8×2</p> <p>$8 + 8 = 16$ $8 \times 2 = 16$</p> </div> <div style="width: 45%; text-align: right;"> <p>Students use the number line to model multiplication. In this example, they see that 8×2 is twice as much as 4×2. The number line shows multiplication as repeated addition or jumps of equal sizes. It helps students see the relationships among multiplication facts, and understanding those relationships builds computational fluency.</p> </div> </div> | |
| <div style="text-align: center; border: 1px solid black; padding: 5px; width: fit-content; margin: 0 auto;"> $4 \times 11 = 44$ </div> <div style="display: flex; justify-content: space-around; margin-top: 10px;"> <div style="text-align: center;"> <p>Closed Array</p> </div> <div style="text-align: center;"> <p>Linear Pieces and Base Ten Area Pieces</p> </div> </div> <div style="margin-top: 10px;"> <p>Open Array</p> </div> | <p>Another important model for multiplication is the array. In this model, the sides are the numbers being multiplied and the area (the number of squares) is the product. In this example, we are multiplying 4 and 11, and the product is 44. The array shows the relationships among these numbers. It can also be used to show a variety of strategies for multiplying. For example, students can also show how to solve 4×11 in this way:</p> <div style="text-align: center; margin: 10px 0;"> </div> <p>$4 \times 11 = (2 \times 2 \times 11) = 2 \times (2 \times 11) = 2 \times 22 = 44$</p> |

| <p>Alexa has 6 seashells. Her sister Jasmine has 3 times as many seashells as Alexa, and her brother Tim has a third as many seashells as Alexa. How many seashells does Jasmine have? How many seashells does Tim have?</p>  <p>The image shows two pieces of handwritten student work. The top piece is titled 'Jasmine' and shows the calculation $6 \times 3 = 6 \times 2 + 6 = 12 + 6 = 18$, concluding with 'Jasmine has 18 seashells.' The bottom piece is titled 'Tim' and shows the calculation $6 \div 3 = 2$ because $3 \times 2 = 6$, concluding with 'Tim has 2 seashells.'</p> | <p>Many story problems invite students to think about multiplication as equal groups. For example, if three siblings each ate 2 cookies, they ate 6 cookies in all. Students also use multiplication and division to solve problems involving comparisons, for example, "3 times as many" or "a third as many." We want students to appreciate that a variety of situations (equal groups, area, equal jumps on a number line, comparisons, rates) call for multiplication and division.</p> |

FREQUENTLY ASKED QUESTIONS ABOUT UNIT 1

Q: Why do some of these activities look like what my child did in third grade?

A: This unit reviews mathematical concepts while introducing and establishing routines that will be used in fourth grade. Teachers assess students' skill level and plan future lessons based on this review. Students also deepen their experiences with multiplication and division by investigating multiplicative comparisons, writing expressions to represent multiplication situations, and solving contextual problems. Another element that is new to fourth grade is an investigation of factors, multiples, and prime and composite numbers.
